                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the DNA sequence of a human methylthioadenosine phosphorylase (MTAse) genomic DNA clone that was isolated from a cosmid gene library using an MTAse cDNA probe. The encoded enzyme catabolises methylthioadenosine to adenine for endogenous salvage incorporation into the intracellular AMP pool. The invention relates to methods for treating and preventing the onset and maintenance of multiple drug resistance (MDR) in animals undergoing cancer chemotherapy. In the methods provided, cells are depleted of AMP and ATP and are thus unable to supprt P-CC glycoprotein activity. One method obtains a population of target cells from a host and assays for loss of MTAse activity. MTAse deficient cells are treated with a purine synthesis inhibitor, such as L-alanosine, which starves the cells of adenine and suppresses P-glycoprotein activity. The Small-cell lung cancer cells, acute lymphoblastic leukemia cells comprising small-cell lung cancer cells, acute lymphoblastic leukemia cells, glioma cells are also treated for MDR with purine synthesis inhibitors. MTAse competent cells are also treated for MDR with purine synthesis inhibitors. MTAse competent cancer drugs. MTase sequence-specific oligonucleotides can be used to detect the presence or absence of MTAse in malignant cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Ma

                                                                                                                          The invention describes a method of detecting methylthicadenosine phosphorylase (MTAse) comprising adding oligonucleotide probes hybridisable to MTAse encoding nucleic acid to an assayable sample of cells, where the presence of the nucleic acid indicates the presence the MTAse in a cell. The inventive method is simple and efficient in detecting the presence of MTAse in the mammalian cell. The availabili of the recombinant MTAse enables the production of highly pure materi with greater ease and in greater quantities than was obtained using Rangione method for the isolation and purification of native MTAse. The sequence encodes rat methylthicadenosine phosphorylase (MTAse)
                                                                                                                                                                                                                                         Detection of methylthioadenosine phosphorylase presence in cells, by adding to sample oligonucleotide probes capable to methylthioadenosine phosphorylase encoding nucleic acid
                                                                                                                                                                                                                                                                                                              (NOBO/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (REGC
                                                                                                                                                                                                                                                                                                The human methylthicadenosine phosphorylase (MTAP) gene on chromosome pp21 (see AAZ35351). The primer is used, with a sense primer (see AAZ35374), in a PCR amplification (505 bp product) in step (a) of claimed lethods for diagnosis of, and determining a prognosis for, cancer lausatively associated with derangements of chromosome 9p21. Step (a) of chese methods involves determining whether any portion of the 9p21 in cortion of the gene encoding MTAP is deleted. Step (b) involves letermining whether any portion of the 9p21 centromeric to STS 3.21 is deleted, or whether any portion of 9p21 centromeric to STS 3.21 is lettermining whether any portion of 9p21 centromeric to STS 3.21 is letted, or whether any portion of the gene coding for p16 is deleted. The results are indicative of a cancer at an early stage or advanced the results are indicative of a cancer at an early stage or advanced the claimed methods, where the cancer is a glioma, primary ymphoid malignancy, non-small cell lung cancer, melanoma, head and neck ancer, ovarian cancer, bladder cancer or a chondrosarcoma (claimed)

OSNA and OSP sequences have cytostatic activity, and can be used in vaccine production and gene therapy. An antibody that specifically binds to an OSP can be used for treating a patient with ovarian cancer, particularly for inducing an immune response against the ovarian cancer cell expressing the OSNA or OSP. The OSNAs and OSPs can also be used for diagnosing and monitoring the presence and metastases of ovarian cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site_1: Not I; Site_2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI_CGAP_GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-687239,
726408-728711, and 729096-731399. Subtraction by Bento
Soares and M. Fatima Bonaldo. "

NCI_CGAP_FT2 is a subtracted cDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions, other donor macrophages in different conditions). The mRNA samples were pooled for library construction. Control 0 hours; control 3 hours; control 24 hours; LPS 100 ng/ml, 3 hours; LPS 100 ng/ml, 24 hours; pMA 10 ng/ml, 24 hours; klebsiella moi 10, 3 hours; Klebsiella moi 10, 24 hours; Klebsiella moi 10, 3 hours; Staph aureus moi 10, 3 hours; Staph aureus moi 10, 24 hours; wt adenovirus moi 500, 24 hours; wt adenovirus moi 500, 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; May vector + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours.
The library was subtracted according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. The tissue was provided by Dr. Gary W. Hunninghake of the University
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           blished
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4939.1

/note="Organ: Stomach; Vector: pCNS; Site_1: EcoRI;
Site_2: NotI; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Top10F' by electroporation method. The cDNA libraries constructed by this method are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Research

/clone_lib=_WCI_CGAP_FT2"

/note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; NCI_CGAP_FT2 is a subtracted cDNA library_constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions, other donor macrophages in different conditions, other donor spended for library control 0 hours; control 3 hours; control 24 hours; Rlebsiella moi 10 ng/ml, 24 hours; Rlebsiella moi 10, 3 hours; Rlebsiella moi 10, 24 hours; Staph aureus moi 10, 24 hours; wt adenovirus moi 500, 3 hours; wt adenovirus moi 500, 24 hours; wt adenovirus moi 500, 24 hours; wt adenovirus + LPS 24 hours.

The library was subtracted according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. The tissue was provided by Dr. Gary W. Hunninghake of the University of Iowa

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKFZ); Email s.wiemann@dkfz- heidelberg.de;
sequenced by EMBL (European Molecular Biology Laboratories,
Heidelberg/Germany) within the cDNA sequencing consortium of the
German Genome Project.
No s1 sequence available.
This clone (DKFZp58601023) is available at the RZPD in Berlin.
Please contact the RZPD: Ressourcenzentrum, Heubnerweg 6, 14059
Berlin-Charlottenburg, GERMANY; Email: clone@rzpd.de.

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster 5445.f

This CDS clone is part of a collection of human full ORF cloring control of the Harvard Institute of Proteomics (HIP) and RZPD.

This CDS has been cloned without stopcodon.

The CDS has been inserted into pDONR201 via a BP Clonase (TM) reaction. Additional sequence has been added in front of the codon: att. .AAAAAA GCA GGC TCC ACC (ATG).

The last codon is followed by the 3' att site: GACCCAGCTTTCTT The clone is validated by full sequence check.

Compared to the reference sequence NM 002451 (GI:6006025) we AA exchange(s) at position (first base of changed triplet):
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Heubnerweg 6, D-14
